

Update: The Healthy Creeks Initiative in 2021

THE HEALTHY CREEKS INITIATIVE IS A MULTI-YEAR PROGRAM.

We have been working to manage populations of invasive Arundo giant cane in the Hill Country at no cost to landowners since 2016. Success depends on cooperation from participating landowners and continued annual cycles of monitoring and treatment until all the roots appear dead for multiple years.

SOMETIMES WE HAVE TO MISS A YEAR.

Due to various circumstances (weather, timing, etc.), it is not always possible to treat a previously sprayed property every year. This is unfortunate, as it does let the Arundo start making headway to regaining its dominance in the area. However, it would take multiple years for the Arundo to catch up to its original coverage, so missing one year is a minor setback.

THIS MIGHT BE ONE OF THOSE YEARS.

In the COVID-19 pandemic, our goal is to keep everyone safe and well – both us and you. Hopefully we can treat some cane too, but we won't compromise safety to do so.

WE ARE ALLOWED TO WORK.

The current state-issued orders do not restrict official state government business. Things may change, though, and we are continuing to monitor the situation.

WE HAVE TO TAKE PRECAUTIONS, AND WE NEED YOU TO AS WELL.

We are taking this seriously, and don't want to put anyone into an uncomfortable, dangerous, or surprising situation. If you want to be present during a site visit, we can meet you at the porch or gate, but we will be maintaining 10 feet of distance and may have our faces covered.

WE ANTICIPATE DELAYS.

We will need to take extra time to coordinate activities, to travel in separate vehicles when possible, to decontaminate shared equipment before and after use, and more.

WE LIKELY WON'T REACH EVERYONE, BUT WE HAVE A PLAN.

We are going to start upstream in each watershed, and survey only about as many properties as we think we can spray. We want to treat the Arundo that is already under treatment, and likely won't add any new landowners in downstream areas this year. Even so, we probably won't be able to reach all of our participating landowners in downstream areas of the watersheds.

WE'RE GOING TO DO THE BEST WE CAN, AND HOPE YOU UNDERSTAND.

If you have any questions, or if you would like us to skip surveying and treatment at your property this year for any reason, just let us know by contacting healthycreeks@tpwd.texas.gov or 512-289-2740 or your local contact on the next page. Please let us know if you would like our "do it yourself" guidelines.

Healthy Creeks Initiative to Combat Invasive Arundo

The Healthy Creeks Initiative is a partnership to protect and improve habitat health along rivers and creeks in the headwaters of the Blanco, Guadalupe, Llano, Medina, and Pedernales watersheds by providing Arundo control at no cost to landowners.

WHAT IS ARUNDO? Arundo (*Arundo donax*) is a large, invasive grass that has increasingly become a problem in Texas in recent decades. It is sometimes also called Giant Reed or Carrizo Cane. This non-native invader has the potential to significantly impact the health of our creeks and rivers.

HOW DOES ARUNDO IMPACT ME? Arundo consumes large quantities of water, reducing river flow, and worsens flooding by lessening the floodplain's ability to dissipate flood energy. Arundo's comparatively shallow, weak roots can increase bank erosion, reducing water quality and causing damage to private property. Arundo stands may harbor pests such as cattle ticks, feral hogs, and nutria. Arundo is highly flammable, which increases wildfire danger, intensity, and frequency.

HOW DOES ARUNDO IMPACT CREEK HEALTH? Arundo is a game changer for sensitive riparian areas (extremely important habitats alongside our creeks and rivers). It reduces water quantity and quality and degrades the quality of instream habitats for native aquatic life. It also crowds out the diverse, native plants that are important for wildlife.

The Guadalupe Bass, our state fish, needs healthy Hill Country creeks.

WHY MANAGE ARUNDO? Invasive plants threaten our natural heritage by harming the function of creeks and the associated riparian areas that are vital to creek health. Native vegetation helps the riparian soil absorb water like a sponge, which reduces runoff of pollutants and bacteria into our waterways. Native plants dissipate the energy of floodwater, and their roots stabilize banks, which reduces erosion. Healthy diverse riparian areas also act as a natural firebreak.

HOW CAN I PARTICIPATE? As part of the Healthy Creeks Initiative, **we are offering no-cost Arundo control for landowner partners in our project areas.** To participate, you'll need to sign a landowner permission form to grant access for treatment and monitoring. You can terminate the agreement any time by email or letter, and you'll always receive advance notice before our staff, partners, or contractors access your property. To learn more, email healthycreeks@tpwd.texas.gov or reach out to your local contact.

- **Blanco & Little Blanco Rivers:** Ryan McGillicuddy, ryan.mcgillicuddy@tpwd.texas.gov, 512-552-3713
- **Guadalupe River (Comal Co. upstream of New Braunfels):** Beverly Lopez, beverly@wordcc.com, 830-907-2300
- **Guadalupe River (City of New Braunfels):** Phillip Quast, pquast@nbtexas.org, 830-221-4651
- **Pedernales (Gillespie & Blanco Counties):** Angela England, angela.england@tpwd.texas.gov, 512-289-2740
- **Upper Guadalupe River (Kerr County):** Tara Bushnoe, tbushnoe@ugra.org, 830-896-5456
- **Upper Llano River (Kimble & Sutton Counties):** Tyson Broad, southllanoriver@gmail.com, 325-248-3137
- **Upper Medina River (Bandera County):** Levi Sparks, lsparks@bcragd.org, 830-796-7260

HOW IS ARUNDO CONTROLLED? Chemical treatment is the most effective method of controlling Arundo and can minimize the impact of control efforts on the riparian habitat. Treated canes and roots are left in place for at least two years after they appear completely dead. This provides stability to the soil and helps reduce erosion while native plants regrow. The dead canes create a nursery area to protect young, native plants. Adding young native plants or seeds within large, dead patches of Arundo can also help to restore the habitat.

WHAT ABOUT OTHER METHODS? Mechanical treatment such as cutting, mowing, or tilling typically makes Arundo problems worse because Arundo thrives on disturbance; fragments often take root downstream, or anywhere they end up. Although hand-pulling of small Arundo plants can be effective if all root material is removed, physical removal of larger stands of Arundo is expensive and labor-intensive. Mechanical removal can destabilize streambanks, leading to erosion and damage to private property. Heavy machinery can also compact soils, which hinders native plant regrowth. Burning in riparian areas is not recommended, because fire rarely kills Arundo roots, and afterward the Arundo grows back faster than native plants do.

WHICH HERBICIDES ARE USED FOR ARUNDO? We use only aquatic-labeled, EPA approved herbicides and adjuvants that have been rigorously tested to ensure minimal risk of harm to aquatic life, in addition to the standard testing required for all pesticides to ensure they won't harm humans or other wildlife, including honeybees, birds, and mammals. The active ingredients in the herbicides we are using to manage Arundo are imazamox and glyphosate. Although many people have concerns about the use of glyphosate, a recent EPA risk assessment found that it is not likely to cause cancer in humans when used according to label requirements. Additionally, we apply these herbicides to the Arundo only once per year (i.e., no potential for chronic exposure) and we use very low concentrations of herbicide to further reduce risks. These herbicides have low toxicity (except for plants) and low tendency to runoff into surface waters. They also have a high affinity for binding with soil, so that they break down in the soil and do not move into ground water.

Our contractors are licensed pesticide applicators who specifically target the Arundo and take precautions to minimize drift and overspray onto the water or nearby plants. They often wade into the creek to spray to reduce overspray onto the water, only spray during low-wind conditions, and may adjust droplet size to prevent drift by using different pressure and nozzle combinations. They also use adjuvants that help the herbicide spray to penetrate the dense Arundo canopy and speed up drying, which further reduces the risk of runoff.

HOW CAN I LEARN MORE ABOUT THE HEALTHY CREEKS INITIATIVE? Arundo management is a high priority for improving creek health. This partnership provides coordination, outreach, funding, and efforts to manage Arundo and other invasive species in priority areas. We're also working to increase awareness of best management practices for creek health—with your help! Visit <http://tpwd.texas.gov/healthycreeks>.

AQUATIC INVASIVE SPECIES HAVE SIGNIFICANT ECONOMIC IMPACTS IN TEXAS. The annual economic impact of aquatic invasive species in the US is estimated at more than \$140 billion. Texas Parks and Wildlife Department estimates that effective management of aquatic invasive species in Texas would require \$45 million annually. Learn more about invasive species in Texas at www.TexasInvasives.org and consider signing up for the [Texas Invasives iWire newsletter](#). Please also check out the Arundo Control Man prevention program at <http://tpwd.texas.gov/ArundoControlMan> and help spread the word!

REMEMBER—NEVER CUT, MOW, TILL, OR BULLDOZE ARUNDO!

(Last updated Feb. 2021)

Healthy Creeks Initiative: What to Expect

Left: Licensed applicator carefully applies aquatic herbicide. **Center and Right:** A few weeks later, canes show signs of damage.

PERSONAL SITE VISIT

Once we receive your signed permission form, we will schedule a site visit to map the Arundo on your property. You do not need to be present unless you want to be. We can also talk with you about riparian health and management options, discuss your specific needs, and answer any questions about treatment.

TARGETED HERBICIDE APPLICATION (NO COST)

Licensed, professional herbicide applicators will carefully apply aquatic-labeled herbicides to the Arundo on your property during the summer or early fall. You will be notified in advance of the application date, though the exact date/time may change with weather and contractor schedule.

WHAT TO EXPECT AFTER TREATMENT

- **Brown dying canes:** After treatment, the canes will begin to turn brown quickly—in a matter of weeks. They need to remain in place, and will look like they do during the winter. **DO NOT MOW OR TILL!**
- **Leave it alone!** After herbicide treatment, it can be tempting to cut or mow the canes. Leaving them in place creates a nursery area for native plants to grow and helps keep it from re-sprouting or spreading. It's best to wait to cut treated canes until the plant has shown no signs of life for two years—otherwise it may be reinvigorated and resprout! Once the canes decay and break off on their own, they can be removed if necessary.
- **Possible non-target damage to other plants:** We take care to minimize non-target damage, but some damage to desirable plants may be unavoidable. Grasses are especially susceptible but will usually re-grow quickly. Trees with brown leaves on a few branches will also usually recover quickly. Take photos of damage and email them to us if you have questions.
- **Arundo regrowth:** The initial herbicide treatment may not completely kill the roots, especially for large patches. We'll visit your property the next year to determine if retreatment is needed.
- **Native/invasive plant emergence:** Soon, native plant seedlings will sprout among the canes. Unfortunately, we'll also need to watch for other invasive plants such as privets, Chinaberry, and Chinese tallow. Take photos and email us if you have questions.

Re-sprouting and side shoot "pups" may appear.

REVEGETATION

Revegetation, whether natural or through seeding/planting, is an important part of riparian restoration. In most cases, native plants will naturally recolonize the area. We may offer to re-seed large patches with Riparian Recovery Seed mix from Native American Seed—a blend of grasses and wildflowers selected for their ability to stabilize stream banks. For extreme infestations, planting native trees among the canes after treatment may be advised.

LANDOWNER PERMISSION FOR INVASIVE PLANT MANAGEMENT & RESEARCH

(Pursuant to Section 12.103 of the Texas Parks and Wildlife Code)

By my signature below, I hereby authorize Texas Parks and Wildlife Department (Department) employees, or persons working on behalf of the Department, to enter private property I own or manage for the purpose of managing invasive species (i.e., herbicide application, biological control agent introduction, or mechanical treatment/removal) or conducting scientific research and investigation regarding invasive species and natural resources, to record and use site specific information from the property for scientific research and investigation, and to allow public access to the information to the degree authorized below.

Authorized scientific research, investigation, management practice, or other associated activity:
Management of Giant Reed (*Arundo donax*) and other invasive plants (e.g., privet, Chinaberry, Chinese tallow) using herbicide or other treatments; site visits for monitoring of treatment effectiveness.

Landowner(s) or Authorized Agents will be notified in advance of each herbicide application and/or monitoring visit if we need to enter the property. Exact dates/times may change with weather and contractor schedule.

OPTION 1 - Release of Information (Location Specific): I hereby further authorize the Department and project partners to use the information collected in reports, maps, publications, or presentations or otherwise make the information available to the public in a manner that could identify the specific location of the private property I own or manage but does not reveal my name or exact address.

Signature (Landowner or authorized agent)	Date
---	------

OR

OPTION 2 - Release of Information (Non-Location Specific): I hereby further authorize the Department and project partners to use the information collected in reports, maps, publications, or presentations or otherwise make the information available to the public only in a manner that is generalized to a level that does not identify the specific location of private property I own or manage and does not reveal my name or exact address.

Signature (Landowner or authorized agent)	Date
---	------

NAME and ADDRESS: (Please print legibly)

Name of Landowner or Authorized Agent			
Property, Ranch, or Tract name (if applicable)			
Property Address	City	State	Zip
Mailing Address (if different)	City	State	Zip
Home Phone	Mobile Phone		
Email Address			

You can return the completed form one of the following ways:
