# 100%

reclaimed non-potable water generated from air conditioning units is used to irrigate the Peterson Regional Medical Center campus.

Only 10-20% of water used to irrigate our campus is from the City of Kerrville. On our designated watering days, we pull water into our tanks to use. Peterson only pulls 1 day per week from the City of Kerrville, not the allotted 2

-Tour of the Tank-

Come take a first hand look at our water tanks and learn how Peterson works hard to save water and improve our environment.

## -Facts About Our Tanks-

90,000 gallons of water are stored in the Peterson tanks.

How It Works:

- 1) Water runs off the air handling units at hospital.
- 2) That water is collected into an intermediate tank, used to catch water from air handling units.
- 3) Collected water is then pumped into the three large storage units seen on front page.

### Why Do You Need To Know?

We are fortunate to reside in a concerned community. Concerned folks see us use water and worry about resources. Proudly, we prove our concern too by our published pledge to top our resources as little as possible (if at all) by repurposing reclaimed water.
